Hello,

Chapter 8, objective 4, on surface and ground water quality, Fracking and Acid Injection are completely ignored. They should be seriously dealt with, and also tied to GHG emissions and climate change. Local and regional CEQA analysis should be recommended, rather than one statewide study to fast track the Fracking process.

Independent regional and local CEQA reviews, with full analysis of alternatives, should also be recommended for all water projects, especially major ones like the two tunnels .

One gets the feeling the two tunnel approach is to be pushed through without honest and thorough assessment of its impacts, and alternatives.

It is very hard to find this epic project in the Contents or Executive Summary. Don't bury the lead.

Thanks,

Michael Oakes
